Queue/Thread expansions

The base configuration of AMB accesses two watch folders/queues as standard. Each queue expansion provides an additional watched folder and/or processing queue, up to a total of 16.

As standard, the base AMB configuration also includes two independent processing threads that optimize workflows by allowing two simultaneous processes to run in parallel. For even greater power and efficiency, an AMB thread expansion can be added; each instance will activate an extra processing thread up to a total of 16.
